

Total Trash Collected from 20 Austin Parks

20 different parks around Austin were surveyed in which data results show that over 58% of the trash collected was cigarette butts. This graph compares the amount of tobacco waste with the amount of overall trash in Austin area parks. This shows the impact tobacco has on the physical ground environment, but also represents increased air pollution and exposure to second hand smoke in these areas.

This graph represents the amount of tobacco related trash (smokeless tobacco, cigarette cartons, cigarette butts, or anything related to tobacco use) by zip codes. The information displays what areas require increased focus on tobacco prevention and more clean up in general. This data shows areas such as downtown, near the UT campus, and the South Congress region (78701, 78702, and 78704) have more tobacco litter than other area zip codes. It also shows that low SES regions (78741) have a much higher content of tobacco related waste.
